NOAA Technical Memorandum NMFS

The National Oceanic and Atmospheric Administration (NOAA) was organized in 1970. It has evolved into an agency which establishes national policies and manages and conserves our oceanic coastal, and atmospheric resources. It provides managerial, research, and technical expertise to produce practical services and essential information for the programs concerned with such resources.

The National Marine Fisheries Service (NMFS) provides the United States with an integrated program of management, research, and services concerned about the protection and rational use of living marine resources for their aesthetic, economic, and recreational value. NMFS determines the consequences of the naturally varying environment and human activities on living marine resources. NMFS provides knowledge and services to foster the efficient and judicious use of those resources. NMFS provides for domestic and for international management and conservation of these living resources of the sea.

To carry out its mission, the organization also provides for communication of NMFS information. In addition to its formal publications, NMFS uses the NOAA Technical Memorandum series for informal scientific and technical publications. These documents are specialized reports that require multiple copies when complete formal review and editorial processing are not appropriate or feasible. The management and control of Technical Memorandums has been delegated to the Research Centers, Regional Offices, and corresponding staff offices within NMFS. Therefore, requests for copies of Technical Memorandums should be sent to the author or to the originating office for the material.

NOAA Technical Memorandum NMFS

This TM series is used for documentation and timely communication of preliminary results, interim reports, or special purpose information; and have not received complete formal review, editorial control, or detailed editing.

INTRODUCTION

This report presents a complete and concise record of tag recoveries for the adult Hawaiian green turtle, *Chelonia mydas*, made from 1973 through 1982 in association with the breeding colony of French Frigate Shoals (FFS). During this 10-year period, the author has systematically monitored and tagged green turtles that assemble each summer at FFS as migrants originating from foraging pastures throughout the Hawaiian Archipelago. Visits to this site have also been made during other times of the year to tag and observe turtles present outside the breeding season. A list of all expeditions is presented in Table 1. A total of 385 research days and nights has been spent at this location.

At least 90% of the reproduction by green turtles in the Hawaiian Islands takes place within the Hawaiian Islands National Wildlife Refuge at FFS. This crescent-shaped atoll is located at about the midpoint of the archipelago and contains 11 sand islets extending over 26 km of reef (Fig. 1). Most nesting occurs on East (4.0 ha) and Whale-Skate (6.8 ha) Islands; nesting activity is lower on Trig, Tern, Gin, and Little Gin. East Island has been the major site of tagging over the past 10 years.

A rare terrestrial basking habit is displayed by green turtles at FFS and several other isolated sites in the Northwestern Hawaiian Islands (NWHI). Males and females regularly haul out to rest along the shoreline during the daytime and also occasionally at night. This behavior has allowed relatively easy tagging of adult males, a segment of sea turtle breeding colonies in other geographical areas that is not usually accessible. Due to the unique basking behavior and the isolated position of FFS in the North Pacific, this breeding colony was one of eight designated for high priority by the World Conference on Sea Turtle Conservation (1982).

A synopsis of biological information to June 1979 has already been prepared on the Hawaiian green turtle (Balazs 1980a). The tag recoveries given in this present report serve to complement the data in the synopsis. Other recent publications available on the Hawaiian green turtle have dealt with natural growth rates (Balazs 1982b), habitat usage at FFS (Dizon and Balazs 1982), and the ecology of basking (Whittow and Balazs 1979, 1982; Sheekey 1982). Overall accounts of the population that have appeared since the synopsis was issued include those by Balazs (1980b, 1982c, 1982e). A popular article by Wexler (1983) contains an array of color photographs showing Hawaiian green turtles.

HISTORY OF TAGGING

Tagging was begun at FFS in June 1973 using No. 49 and No. 681 Monel² alloy flipper tags made by the National Band and Tag Company of Newport, Kentucky. In September 1976, the use of these tags was discontinued after detection of excessive corrosion. A total of 310 adult turtles had been

²Reference to trade names does not imply endorsement by the National Marine Fisheries Service, NOAA.

marked with these tags between 1973 and 1976. Since then, No. 681 flipper tags made of Inconel 625 alloy have been the principal means of marking turtles. The dimensions of these tags are 25 x 8 x 9 mm, and up to four tags have been applied to each turtle. The No. 49 tags were somewhat larger, measuring 40 x 10 x 11 mm. No signs of corrosion have been seen to date in the Inconel tags. Corrosion and various other factors affecting the retention of flipper tags have been discussed in Balazs (1982a). At the end of 1982, a total of 605 adult turtles had been tagged at FFS with Inconel tags.

Prior to 1973, the tagging of green turtles in the NWHI was initiated in the early 1960's by the Hawaii State Division of Aquatic Resources (formerly Division of Fish and Game). Shortly thereafter, personnel of the U.S. Fish and Wildlife Service (known then as Bureau of Sport Fisheries and Wildlife), and the Pacific Ocean Biological Survey Program (Smithsonian Institution), began tagging turtles during intermittent survey and inspection visits to the area. By 1972, approximately 800 adults had been tagged as a result of these combined efforts. All turtles were tagged with No. 49 Monel tags bearing three different return addresses. The exact wording of these inscriptions is presented in the Key to Abbreviations. Amerson (1971) gives a historical overview of tagging and turtle observations at FFS until 1969. This present report also includes tag recoveries made between 1973 and 1982 of turtles that were initially tagged before June 1973. However, tag recoveries made before 1973, but not resighted between 1973 and 1982, are not reported here. These earlier records are fewer in number, due at least in part to excessive corrosion and tag loss. Some, but not all, of the pre-1973 tag recoveries are contained in unpublished trip reports of the U.S. Fish and Wildlife Service. The titles, dates, and authors of these reports are listed in Balazs (1980b). A card catalog of pre-1973 taggings and tag recoveries is on file at the Honolulu office of the U.S. Fish and Wildlife Service. A future report will be prepared to summarize the contents of this card catalog so that the basic results of this past work will also be readily accessible.

RECOVERY DATA

Over the 10-year period, 294 tagged turtles have been resighted either at FFS or at other localities after they were originally tagged at FFS. This total consists of 87 males (Table 2) and 207 females (Table 3). In most cases, the minimum interval between tag recoveries is the time between expeditions undertaken by the author to FFS (as shown in Table 1). Short-term recoveries, such as those that frequently occur within a single expedition (i.e., interesting-interval recoveries), are not presented as part of this report.

Forty-eight of the 87 males shown in Table 2 were recovered only once, whereas the remaining 39 (44.8%) were each seen on two or more occasions. The male resighted the greatest number of times (10) appears as Entry No. 9 in Table 2. For the females, 147 of the 207 individuals were recovered only once. The other 60 (29.0%) were resighted on two or more occasions. Entry No. 24 in Table 3 lists the female seen most often (nine times).

Long-Distance Migrations

Migrations by males have been documented by tag recoveries on nine occasions during the 10-year period. Two of these resightings constituted a round-trip voyage by the same male traveling from Pearl and Hermes Reef to FFS and back again (Entry No. 21 in Table 2). The other movements by males are as follows:

<u>No. of turtles</u>	<u>Migration</u>	<u>Table 2 Entry Nos.</u>
2	Oahu to FFS	24, 61
1	Pearl and Hermes to FFS	26
3	FFS to Pearl and Hermes	55, 60, 77
1	FFS to Lisianski	78

Migrations by females have been documented on 39 occasions and include 6 round trips (Entry Nos. 11, 39, 41, 101, 104, and 159 in Table 3). Two of these were between Pearl and Hermes and FFS, two between Lisianski and FFS, one between Laysan and FFS, and one between Oahu and FFS. The remaining 27 one-way migrations recorded from tag recoveries consisted of the following:

<u>No. of turtles</u>	<u>Migration</u>	<u>Table 3 Entry Nos.</u>
6	FFS to Pearl and Hermes	105, 106, 151, 153, 204, 205
2	FFS to Lisianski	147, 206
3	FFS to Laysan	156, 157, 158
2	FFS to Oahu	5, 150
1	FFS to Maui	16
1	FFS to Kauai	17
1	FFS to Hawaii	53
1	FFS to Molokai	207
6	Pearl and Hermes to FFS	12, 14, 37, 42, 43, 103
1	Lisianski to FFS	10
1	Oahu to FFS	28
1	Hawaii to FFS	76
1	Niihau to FFS	13

Prior to 1973, 32 long-distance migrations were documented from tag recoveries made in earlier tagging efforts (see Balazs 1980a). Consequently, a total of 80 migrations (32 + 48 shown in this report) has been recorded in the Hawaiian Islands. Of these, 36 are between FFS and the main islands located at the southeastern end of the chain, and 44 are between FFS and the northwestern sites of Laysan, Lisianski, and Pearl and Hermes Reef. When compared with other tagging studies of the green turtle, the evidence for migrations from tag returns in the Hawaiian Islands is among the best gathered anywhere (Meylan 1982).

The known migrations documented from tagging at other islands in the Pacific have been summarized by Balazs (1982d).

Reproductive Cycles

Reproductive cycles, as measured by remigration intervals, have been documented in 52 males and 130 females. For males, 42.3% displayed a 1-year cycle, 32.7% a 2-year cycle, and 25.0% a 3-year cycle. For the females, 36.2% showed a 2-year cycle, 43.1% a 3-year nesting cycle, 7.7% a 4-year cycle, and 12.2% nested at intervals ranging from 5 to 8 years. In addition, a single female nested again after an interval of only 1 year. All of these intervals are undoubtedly affected to some degree by tag shedding rates.

Site Fidelity

A total of 383 tag-recovery data can be used to determine the degree of site fidelity turtles display for particular islets at FFS. For the 139 resightings of males, 86.3% occurred on the same islet where they were previously seen. For the 244 resightings of females, 90.6% occurred on the same islet. Females nesting and basking on East Island showed the greatest site fidelity; 94.4% of the resightings occurred at this same location.

Longevity

The longevity and duration of reproductive life for green turtles in the wild are presently unknown. Long-term tag recoveries can, however, help to answer these important questions. The longest recovery interval thus far recorded for a male in the Hawaiian Islands is 17 years, 8 months (Entry No. 21 in Table 2). The longest for a female is 18 years, 3 months (Entry No. 11 in Table 3). Both of these turtles were originally tagged as adults in 1964 while they were basking at Pearl and Hermes Reef.

Frequency of Tag Recoveries.

The percentage of previously tagged turtles seen nesting each summer at FFS has increased considerably over the 10-year period:

1973 - 10.0%	1978 - 7.7%
1974 - 11.9%	1979 - 19.2%
1975 - 2.2%	1980 - 46.7%
1976 - 17.4%	1981 - 36.7%
1977 - 2.6%	1982 - 41.1%

The reasons for these higher recovery rates most likely include 1) a reduced tag loss from using No. 681 Inconel tags, 2) the practice of applying more tags on each turtle, 3) greater survival of turtles in resident foraging pastures since they became legally protected in late 1978 under the Endangered Species Act, and 4) the greater percentage of the adult population tagged at the end of each successive year over the 10-year period.

The frequency of tag recoveries at FFS during recent years is markedly higher when compared with long-term tagging projects at other breeding colonies. For example, only approximately 20% of the Caribbean green turtles nesting each summer in Costa Rica bear tags that were applied during previous years (Meylan 1982).

Tag Loss

Attaching two or more tags to each turtle increases the chances for future recognition. It also provides a basis for measuring rate of tag shedding. During the 1981 and 1982 breeding seasons at FFS, 59 nesting females were recovered that had previously been double tagged with Inconel tags (one on each front flipper). The recovery intervals for these turtles ranged from 2 to 5 years. Table 4 presents the estimated probability of tag shedding and the 95% confidence limits for each of these time intervals. A cumulative shedding rate of 30% after 4 years is indicated by these data. Consequently, there is a 9% chance (0.30×0.30) that a double-tagged turtle will lose both of its tags in 4 years. Tag recoveries anticipated during the 1983 and 1984 breeding seasons will help to determine if the rate of tag loss changes after 5 to 6 years. Forthcoming recoveries at FFS will also include a number of recoveries of turtles originally receiving three and four tags.

The shedding rates shown in Table 4 are the first values of this kind to be computed and published for sea turtles. Double tagging conducted elsewhere, as analyzed and discussed by Mrosovsky and Shettleworth (1982), has confounded variables such as tag type (metal versus plastic), tag color, front or hindflipper placement, sex, and size class (adult versus immature).

KEY TO ABBREVIATIONS

The following abbreviations identify the agencies that tagged turtles in the Hawaiian Islands.

- FG Tags bearing a return address of the State of Hawaii, Division of Fish and Game (now the Division of Aquatic Resources).
Exact inscription: "RETURN TO FISH & GAME STATE OF HAWAII."
The letters FG do not actually appear on the tags, but are used in the data tables as an abbreviation.
- FW Tags bearing a return address of the U.S. Fish and Wildlife Service. Exact inscriptions: "U.S. WILDLIFE HONOLULU" or "NOTIFY U.S. WILDLIFE HONOLULU, USA" or "BUREAU WILDLIFE KAILUA, HAWAII." The letters FW do not actually appear on the tags, but are used in the data tables as an abbreviation.
- T Tag number prefix present on tags used by the U.S. Fish and Wildlife Service bearing the inscription "BUREAU WILDLIFE KAILUA, HAWAII."

Tag numbers shown in the data tables that do not have an FG or FW abbreviation all bear one of the following return address inscriptions:

"UNIV. HAWAII HIMB BOX 1346 KANEOTE, 96744"	No. 49 Monel tags numbered 601-900
"NOTIFY UNIV. HAWAII MARINE LAB, BOX 1346 KANEOTE, HAWAII USA"	No. 49 Monel tags numbered 901-1400
"NOTIFY UNIV. HAWAII HIMB KANEOTE, 96744"	No. 681 Monel tags numbered 1401-1900
"NOTIFY HIMB UNIVHAWAII"	Fearing "Tuff-Tex" plastic tags 2001-2015 (blue) and 2026-2050 (black)
"WRITE HIMB UNIVERSITY HAWAII, 96744"	No. 681 Inconel tags numbered 2051 and higher

Letters and abbreviations refer to the following:

A	Plastic "Allflex" tags (not inscribed with a return address)
F	Fearing "Tuff-Tex" plastic tags
()	Numbers in parentheses indicate additional tags that were applied when a previously tagged turtle was recovered.
FFS	French Frigate Shoals
SE	Southeast Island at Pearl and Hermes Reef
N	Nesting
B	Basking on shore
O	Offshore - turtle recaptured or resighted in the ocean
C	Copulating
RC	Released from captivity after being held for an extended period
D	Dead
A-D meter	Small depth meter attached to the carapace (see Balazs 1980b).

Freq. Frequency and turtle identification number of radio transmitters used in a telemetry study at FFS (see Dizon and Balazs 1982).

The following abbreviations are used at various places in the data tables to show the person responsible for making a tag recovery or, in some cases, initially tagging a turtle. All taggings and tag recoveries that bear an expedition number were carried out by the author working at FFS (Table 1). In certain instances, the author's initials are given for tagging and tag recoveries made at sites away from FFS where expedition code numbers do not apply.

Table 4.--Shedding rates of Inconel tags: 59 recoveries of double-tagged green turtles at French Frigate Shoals during the 1981 and 1982 breeding seasons (analysis by J. A. Wetherall).

Recovery interval in years (i)	No. of turtles with no tags shed	No. of turtles with one tag shed	Estimated probability of tag shedding ($1-\hat{K}_i$)	95% confidence limits on $(1-\hat{K}_i)$	
				Lower limit	Upper limit
2	12	5	0.17	0.02	0.32
3	17	10	0.23	0.09	0.37
4	7	6	0.30	0.07	0.53
5	1	1	0.33	0.00	0.95

$$\hat{K}_i = \frac{2r_{di}}{r_{si} + 2r_{di}}$$

where: \hat{K}_i = Probability of tag retention from the time of tagging until the midpoint of the recapture period i years later.
 r_{di} = Number of turtles recovered with two tags i years after tagging.
 r_{si} = Number of turtles recovered with one tag i years after tagging.

RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167. Paper copies vary in price. Micro-fishe copies cost \$3.50. Recent issues of NOAA Technical Memorandums from the NMFS Southwest Fisheries Center are listed below:
